

Criterza - AI-Assisted Lead Management Workflow

A practical prototype for turning messy commercial inquiries into a structured, AI-assisted operations workflow: lead capture, data organization, priority classification, suggested response, follow-up tracking, and proposal support.

Built with Make	Google Sheets CRM	AI-assisted analysis	Commercial operations	Workflow documentation

Criterza — AI-Assisted Lead Management Workflow

Tools Used

Case summary

Problem	Solution	Expected impact
Leads arrive through different channels with incomplete context. Without a clear system, teams lose time organizing data, deciding priority, writing responses, and remembering follow-ups.	A simple AI-assisted workflow captures lead information, stores it in a CRM-style spreadsheet, analyzes the inquiry, suggests next actions, supports follow-up, and connects the data to proposal preparation.	Faster response time, less repetitive work, clearer commercial traceability, better lead prioritization, and reusable workflow logic for small service businesses.

Workflow logic and implementation notes

1. Lead Capture Inquiry enters through a form, landing page, email, or manual intake.	2. Data Registration Contact details, company, pain point, source, and service need are logged in a CRM-style sheet.
3. AI Analysis AI summarizes context, identifies the main need, and prepares structured lead notes.	4. Priority + Next Action The lead is classified as high, medium, or low priority and a recommended action is generated.
5. Suggested Response AI drafts an email or message suggestion for human review before sending.	6. Follow-Up Management Status, next action, review date, and notes are tracked to avoid losing opportunities.
7. Proposal Support Lead data can feed a proposal template with problem, diagnosis, solution, and scope.	8. Operational Outcome The process becomes easier to monitor, repeat, document, and improve over time.
Tools used Make, Google Forms, Google Sheets, Gmail, Google Docs, ChatGPT, Claude. Next stack to replicate Zapier + n8n, including webhook/API practice.	Important note Personal learning and portfolio project, not a production client system. Created to demonstrate AI operations thinking: process mapping, tool selection, workflow logic, documentation, and reusable automation structure.
Interview walkthrough script "I created this personal learning project to simulate how a service business can manage incoming leads with AI support. The workflow captures lead data, organizes it in a Google Sheets CRM, uses AI logic to summarize the request and suggest a priority, prepares a response draft, and tracks follow-up actions. The goal was to reduce manual work, improve response speed, and create a reusable system that a non-technical team could understand and operate."
